BioScience Laboratories approved to test MRSA on Human Volunteers

Bozeman, Montana, February 10, 2009 — BioScience Laboratories can now test a product's efficacy when challenged with Methicillin-resistant *Staphylococcus aureus* (MRSA) on human skin. The recent approval from an independent institutional review board to apply MRSA US100 to human volunteers in clinical studies marks an important step forward for the infection control industry.

BioScience Laboratories' in vitro laboratory has a collection of over 200 MRSA strains. The in vitro and clinical laboratories are equipped to test not only MRSA, but many other emerging nosocomial pathogens, including *Clostridium difficile* spores and other drug-resistant bacteria strains that have become a growing concern for infection control professionals.
